

Duncan et al. Supplementary Figure 7

**Supplementary Figure 7: Lineage markers are equivalently expressed in uninfected KTLS cells transduced with control or dnXSu(H) retroviruses**

Freshly purified WT KTLS cells were infected with either dnXSu(H) or control retroviruses. After 48 h infection, cells were analyzed by flow cytometry for expression of GFP and lineage markers. Uninfected (GFP<sup>-</sup>) cells are shown (see **Fig. 3a** for analysis of the GFP<sup>+</sup> population). Results are representative of four independent experiments.
